NEW THEMES

What's Changed: There is now an increasing number of consumers who prefer goods or services that are uniquely tailored for them and do not mind switching to other brands or products that can cater to their personalized needs. How does this affect household products companies? Read more on page 21.

What's Changed: As consumers are becoming more eco-conscious, we think this is a good opportunity for companies to improve consumers' trust in their brands by sourcing more earth-friendly ingredients for their products. Check out page 22.

EXECUTIVE SUMMARY

CFRA holds a neutral fundamental outlook on the Household Products industry. Below are the recent trends and catalysts impacting the industry and its participants.

Consumer Tightens Spending Belt but Absorbs Price Hikes

Consensus views for the first quarter of 2023 pegged consumer wallets as fairly stretched and expected the Household Products industry to deliver lower sales. On average, household products under our coverage beat consensus expectations by more than 4%. The outperformance was delivered on pricing initiatives that came in ahead of expectations, with most industry participants maintaining pricing levels observed in the fourth quarter of 2022, showing the consumer is still absorbing pricing. We do note, however, that shopping trips and basket sizes, when adjusted for inflation, are both retracting, in our view, but so far trade-down has been reported to be minimal and elasticities have been in line with management's expectations.

Opportunities to Engage Consumers

Despite the recent uptick in consumer confidence, we are skeptical of a meaningful increase materializing in the near term with the Expectations Index registering below the 80 level, associated with recession, for the better part of the last year and a half. Despite these economic indicators, our concerns are tempered by rising wages and rising real disposable incomes that allow opportunities to engage consumers, which do not include promotional activity. We think companies that invest in product innovation that provides multiple solutions in one package will outperform peers. We view this strategy favorably as consumers may perceive it as a savings tactic in an inflationary environment compared to buying two items or having to choose between one product and another.

The American Consumer Faces Incoming Headwinds

The innovation strategy will be key to performance in the second half of 2023, as we expect consumer wallets to face new headwinds that were put off through pandemic-related economic stimulus. Two initiatives giving extra room in consumer wallets include the extended SNAP emergency allotments and the student loan repayment moratorium. The extended SNAP benefits ended toward the end of the first quarter and the rollback effect may not have been well captured in the first quarter results, but we do expect this to be a headwind for the remainder of the year as consumers adjust their budgets. The end of the student loan payment moratorium, which will go into effect in September at the latest, has kept approximately \$4-\$5 billion per month in consumer pockets, according to Washington Analysis, a CFRA business, and will impact consumers' disposable incomes.

Margin Expansion Realization Path Is Limited

Sales expectations for the Household Products industry have increased approximately 4% in the first five months of the year. However, the increase in sales has not translated into bigger operating margin expansion opportunities. With expected headwinds pressuring the consumer, investments in innovation are expected to continue offsetting top-line growth. Supply chains have recently benefited from a pull-back in transportation costs, which have lifted margins, but pressure from commodity costs remains. Commodities in aggregate have remained stable, but fluctuations in prices continue to be a concern, though fears of the reopening in China exacerbating this headwind have largely gone unrealized. With a potential slowdown in demand, we expect costs to subside, but even if they materialize sooner than anticipated, we expect this benefit to be offset by investments in innovation and marketing and advertising.

HISTORICAL INDEX PERFORMANCE

Source: S&P Global Market Intelligence.

FINANCIAL METRICS

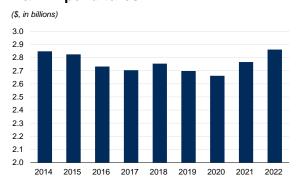

Gross Margin Growth

Source: S&P Global Market Intelligence, S&P Capital IQ Consensus Estimates.

- The industry experienced record inflation and unprecedented supply chain challenges in 2021 and most of 2022, resulting in industry-wide gross margin compression. The second half of 2023 is expected to bring margin expansion opportunities as a result of lapping and, to a lesser degree, commodity cost pull-back.
- We continue to see an easing of packaging labor, transportation, and freight. With volumes and pricing coming in ahead of expectations, companies have lowered the incremental cost headwind guidance.
- Procter & Gamble forecasts \$3.5 billion of aftertax incremental cost headwinds in FY 23 (June). This is down from \$3.9 billion in the first quarter (September).
- Kimberly-Clark expects input costs to be up between \$100 million and \$200 million in 2023, which is \$100 million less than the initial 2023 guidance. We expect Kimberly-Clark's costs to remain elevated in the first half of 2023 due to its portfolio exposure to pulp prices.

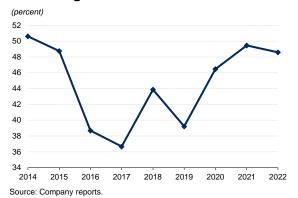

R&D Expenditures

Source: S&P Global Market Intelligence

- Research & development (R&D) leads to innovation and sales growth if properly balanced with increased advertising and marketing spending. We forecast R&D expenditures to remain at elevated levels, as innovation is key to fighting off competition and attracting consumption in an inflationary environment.
- In 2023, companies are expected to continue innovating core and adjacent products to compete against lower-priced, private label brands. Premiumization is also a strategy for boosting gross margins.

Percentage of International Sales

- International markets present a growth opportunity for household products companies due to a growing middle class and relatively low household penetration.
- Unfortunately, many international markets (particularly emerging markets) were disproportionately impacted by Covid-19, leading to weaker-than-expected international sales for many household products companies.
- International sales are bouncing back as the world adapts to living with Covid-19, and the Household Products industry hasn't taken its foot off the pedal. In fact, companies are increasing investments in these markets to capture longterm growth.
- The pull-back in the U.S. dollar in the first half of 2023 also helped international sales as the industry faced lower translational headwinds.

KEY INDUSTRY DRIVERS

U.S. Consumer Confidence Index (CCI)

*Data through May. Source: The Conference Board.

- ◆ Consumer confidence retreated as inflation ticked up in 2021 through 2022. Since inflation hit its peak in June 2022, consumer confidence has remained near or above the 100 level, signaling average confidence that is fueled, in part, by low unemployment and favorable wage growth despite interest rate hikes, in our view.
- May 2023's CCI fell 1.0%, the smallest decline since March 2022. We expect year-over-year increases in June and July, as we lap low CCI readings from the year ago period. However, the Conference Board Expectations Index has remained below 80 every month (except December 2022) since February 2022. The 80 level is associated with recession within the next year.

U.S. Consumer Price Index (CPI)

*Data through May; e-Estimate. Source: Bureau of Labor Statistics, Action Economics.

- ◆ The May CPI reading came in at 4.0%, down from the year ago period and the June 2022 high of 9.1%. The figure reached a 40-year high amid rising food and fuel prices brought on mainly by the Russia-Ukraine conflict, but has since declined for 10 consecutive months.
- However, we forecast CPI figures to level at 3.0% in 2023 amid easing supply chain pressures and receding consumer demand. This is higher than our original forecast of 2.6%, as inflation is proving to be stickier with consumer demand coming in ahead of expectations.

U.S. Producer Price Index (PPI)

*Data through May; e-Estimate. Source: U.S. Department of Labor, Action Economics.

- Inflation continues its descent, as easing in input costs materialize and supply chain challenges have largely abated.
- Food and Services are the leading contributors to the elevated May 2023 PPI reading. The May reading came in at 1.1%, the lowest reading since January 2021 and the 12th consecutive monthly decline.
- As many fears of energy disruptions brought on by the Russia-Ukraine conflict have gone unrealized, energy declines have contributed to the PPI's descent. The declines have also been aided by a pull-back in transportation and warehousing. The confluence of these two items has been margin accretive to the Household Products industry.

U.S. Real Disposable Personal Income

*Data through April.
Source: Federal Reserve Bank of St. Louis.

- The U.S labor participation rate remains below pre-pandemic levels and has fueled a competitive job market leading to wage increases.
- With the remaining Covid-19 fiscal stimulus in consumer wallets expected to deplete by end of 2023 and a tight monetary policy, the U.S. personal savings rate remains below prepandemic levels, despite the recent year-overyear increases in real disposable personal incomes.
- Real personal income increased to \$15,566 billion in April 2023 compared to \$15,560 billion in March 2023, according to the Bureau of Economic Analysis.
- The estimate in April reflects a monthly improvement in U.S. real disposable personal income due to higher compensation. We expect this lift in consumer income to sustain demand in the Household Products industry.

INDUSTRY TRENDS

Industry Outlook and Profitability Overview

Our 12-month fundamental outlook for the Household Products industry is neutral. Demand has moderated from the pandemic highs but remains above pre-pandemic levels. We believe this trend will continue into the future as consumers have newly formed habits including forever altered health, hygiene, and cleaning habits, driven by the pandemic. This trend should prove positive to the industry participants' top-lines even in an inflationary environment if companies innovate and premiumize products and invest in marketing to remind and educate consumers on solutions that their products offer. Growing consumer wages have allowed for the absorption of implemented price increases and we expect companies that innovate products that offer multiple solutions will encourage consumers to buy their products inclusive of new markups. Our view on top-line performance is tamed by incoming headwinds for the U.S consumer as they face rollback in extended SNAP benefits and the end to the student loan moratorium. Nonetheless, we expect outperformance from industry participants that offer multiple solutions in one product, potentially staving off consumer trade down to value brands and private labels.

Although top-line performance should preserve, if not expand, margins, investments in R&D, marketing, and advertising may offset some of the benefits. The largest contribution to margin performance in the first half of 2023 has been the normalization of supply chains, including transportation costs. Input costs, which have been a headwind in the past year, have largely stabilized in aggregate, but fluctuations are still present and could push back margin advancement.

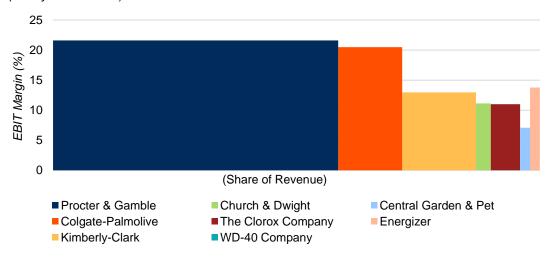

The Household Products industry is within the Consumer Staples sector. The following charts illustrate the profitability map of the Consumer Staples sector and Household Products industry.

PROFIT SHARE MAP OF THE CONSUMER STAPLES SECTOR (2017-2022 average) 45 ■ Consumer Staples Distribution & Retail 40 Tobacco 35 Beverages 30 ■ Household Products 25 Food Products 20 ■ Personal Care Products 15 10 5 0 (Share of Revenue)

Competitive Environment

Below, we use the Porter's Five Forces framework to analyze the competitive environment of the Household Products industry.

1) Threat of New Entrants (Moderate)

The industry has a moderate threat of new entrants since less time and money are required for a competitor to enter the household goods market vs. other industries. However, to be successful in this industry, economies of scale are needed to compete with large companies like Procter & Gamble. Since economies of scale and strong distribution channels are difficult to achieve immediately, we think there is a moderate force of new entrants entering the market. Refer to the "How the Big Get Bigger" paragraph within the "How the Industry Operates" section for further information.

2) Threat of Substitutes (Low)

Although the degree of competition in this industry is relatively high, there is a low threat for substitute products, in our view. For example, it is unlikely that consumers will substitute toothpaste or laundry detergent with a completely different product to clean their teeth or clothes. Consumers may choose to use other brands (further illustrating the high degree of competition); however, in our view, they will not be able to find any other relevant substitutes.

3) Bargaining Power of Buyers (Low/Moderate)

The bargaining power of the buyer deals with how much power a buyer must have to drive prices down. From the perspective of the consumer, bargaining power is low. A collective group of consumers is much more important to the industry than any individual consumer. Therefore, the client base is not strong individually but much more powerful when acting collectively. However, from the perspective of the retailer, including mass merchandisers, grocery stores, membership club stores, distributors, drug stores, etc., its bargaining power is higher than the consumer. A major reason is Walmart, a customer of most companies in this industry. Clorox, Procter & Gamble, Kimberly-Clark, Colgate-Palmolive, and Energizer have more than 10% of their sales with Walmart. As such, Walmart has the bargaining power to control prices since the retailing giant does not rely on any single supplier and is aware of the suppliers' reliance on Walmart's purchases.

4) Bargaining Power of Suppliers (Low)

Suppliers support this industry with the availability of raw and packaging materials needed for business operations. This industry has several key raw materials, including pulp, resin, natural gas, crude oil, chemicals, industrial products, and fibers. Most companies in this industry do not rely on a single supplier for raw materials; however, some unique raw materials do come from single-source suppliers. Also, most raw and packaging materials are commodities, so there is little to no way to differentiate the product. Therefore, in our view, there is low bargaining power of suppliers to control prices.

5) Degree of Rivalry/Competition (Very High)

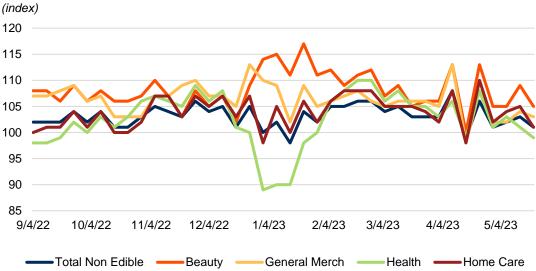

The degree of rivalry and competition for this industry is particularly high due to the number of available products offered by small and large companies, including some well-known global competitors. Switching costs are low-to-none for consumers since they can easily switch from one brand to another. In many markets, products compete against other branded products as well as retailers' private label brands. Product cannibalization is another factor to consider in the Household Products industry. Companies like Procter & Gamble have several brands within the same product line that compete against each other. Ideally, cannibalization hurts sales of one brand to increase the total sales of all the brands that a company owns within that product line. In our view, the degree of rivalry and competition will continue to be very high in all fast-moving consumer goods industries. Refer to the "How the Big Get Bigger" paragraph within the "How the Industry Operates" section for further information.

FACTORS THAT DRIVE MA	RKET SHARE
1. Innovation	How well is the company innovating? Do new products resonate with the consumer? A useful metric to analyze innovation is the percentage of sales derived from products introduced in the last few years.
2. Price	The goal is to set prices that maximize sales and profits. Common pricing strategies include: 1) cost-based pricing; 2) competitive pricing; 3) penetration pricing; 4) value-based pricing; and 5) price skimming.
3. Product Quality	Quality of product and packaging relative to the competition. Does pricing strategy match with product and packaging quality?
4. Service Levels	How well is the company meeting customer demand? Is demand outpacing supply and resulting in customer orders being put on allocation?
5. Convenience	Is the product making the life of the consumer easier? Does the product get the intended job done effectively and efficiently?
Brand Recognition and Loyalty	How well is the brand known? How is the brand perceived? Is there strong customer loyalty backing the brand?
7. Marketing and Distribution Effectiveness	The goal is to convince consumers to buy the product. Also, are the products located in the right channels (<i>e.g.</i> , mass, drug store, discount store, club store, theater, vending, etc.)?
8. Promotional Activity	Is the company using an effective promotional strategy? Are promotions driving a higher return on investment?
Source: CFRA.	

Sales Growth Driven by Higher Prices

The Circana CPG Demand Index provides a standard metric for tracking changes in spending on consumer-packaged goods. It measures weekly changes in consumer purchases, by dollar sales, against the year-ago period across departments, including fixed and random weight products, grocery aisles, and retail formats. As seen in the figure below, inflation has lifted sales of beauty, health, and home care products. Adjusting for inflation, we believe unit sales are modestly declining versus year-ago periods. Going forward, we expect weekly sales to pull back in tandem with inflation and to fluctuate reflecting the level of promotional activity by market participants.

CPG DEMAND INDEX*

*Y/Y Change. Note: Index <100 = Decline, >100 = Growth Source: Circana.

Inflation Is Proving to Be Sticky

We've seen persistent and pervasive inflation flood the U.S. economy for the better part of the last year and a half. Inflation has continued its path out of its 40-year high back in June 2022, but the Federal Reserve has still maintained its restrictive monetary policy by raising its benchmark rate to a 16-year high in May 2023 but choosing to skip a hike in June 2023. While there has been a healthy debate on the causes of this inflationary cycle, there is no doubt that expansionary monetary and fiscal policy and supply chain bottlenecks are a few reasons for the current supply-demand imbalance. We see recent economic data demonstrating a resilient consumer, which could encourage at least one more rate hike in 2023.

OVERALL CONSUMER PRICE INDEX (CPI) (Y/Y CHANGE)

Note: Data through April 2023.

Source: U.S. Bureau of Labor Statistics.

For the Household Products industry, most companies are facing labor pressures and higher raw material prices. For example, pulp, the main raw material used in most paper-based products like tissue paper, paper towels, diapers, etc., is a commodity with prices that are at all-time highs but have remained stable since August 2022 and are expected to abate in the second half of 2023. Fears of a reopening of the Chinese economy pushing prices further have largely gone unrealized and lower consumer demand has pressured pulp prices sooner than anticipated. According to the U.S. Bureau of Labor Statistics, producers paid, on average, 14% more year-over-year for pulp, paper, and allied products in April 2023. Over the past two years, pulp, paper, and allied product costs have surged approximately 31%.

Transportation costs are also still increasing, albeit at a slower rate. According to the Cass Truckload Linehaul Index, which tracks per-mile truckload linehaul rates (ex-fuel), inferred freight rates declined 11.9% year-over-year in April 2023 after falling 8.3% in March. Freight volumes have declined recently and are primarily attributed to declining real retail sales trends and ongoing destocking. The recent decline in transportation costs has proved beneficial to industry margins and is one less input cost that will need to be passed on to the consumer moving forward.

Managing Inflation

Due to accelerating cost inflation, manufacturers and retailers implemented pricing actions and costsaving strategies to support their margins. Generally, larger manufacturers and retailers lead when it comes to raising prices, and then the smaller manufacturers and retailers follow. CFRA anticipates household products manufacturers' top-lines to consist of a price/mix contribution in the range of 5%. This contribution will be largely derived on already implemented price increases in previous quarters.

In addition, we anticipate most household products companies looking to generate about 2%-3% of productivity savings, which should benefit the cost of goods sold and help support gross margins. As a result, we think household products companies will be able to manage about 7%-8% of cost inflation leading to margin expansion, unless consumer demand impacts volumes meaningfully, offsetting some of the benefit.

Tools to Manage Inflation

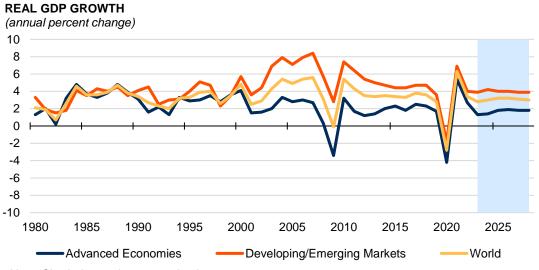

Pricing	Mix	Cost Savings	Other
	Country mix	paoragilig	Contracts
Innovation	Product mix	Reformulating products or packaging	Hedging / Forward Contracts
Lower promotional activity	Segment mix	Automation	Divestitures
Price-pack architecture	Brand mix	Synergies	Acquisitions
List price increase	Channel mix	Productivity	Fixed cost leverage

Operating Environment

Growth Potential in Emerging Markets

Despite widespread inflation, we still think emerging markets have much to offer. Latin America and Asia-Pacific offer the best prospects for long-term growth, in CFRA's view, although Eastern Europe is also very important for some companies, notwithstanding its proximity to the ongoing Russia-Ukraine conflict. Per Euromonitor, Southeast Asia accounted for 19% of home care sales in Asia Pacific, second only to China. Euromonitor expects home care sales to grow at a 5.4% CAGR between 2022 and 2027, with the majority of the growth attributed to laundry care sales, representing an important opportunity for industry participants.

In developing countries, social changes like urbanization and improvements in living conditions are crucial to the industry because they can increase the per-capita consumption of basic household products. GDP, disposable income, and population growth for some regions outpace the U.S. and Western Europe. We continue to see household products companies focusing on opportunities outside their home markets in 2023 and beyond.

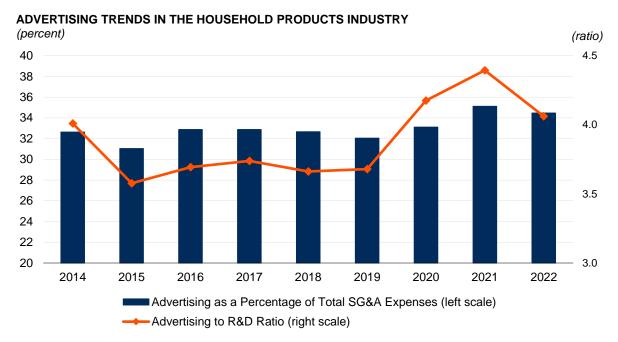

Note: Shaded area denotes projection. Source: International Monetary Fund.

In CFRA's view, it is important for a company to enter developing markets while its brands are still in the early stages of growth. Once those brands are established, the company will likely maintain a strong position as these markets mature. However, a company that neglects its market share in industrialized nations while focusing on new growth markets will likely falter because of the long time horizon for meaningful profits in these undeveloped countries.

Advertising Is More Than a Discretionary Expense

In general, CFRA does not view advertising as a discretionary expense in the Household Products industry. However, on a short-term basis, a company can temper advertising spending to help boost earnings. Additionally, when demand is naturally high, companies tend to cut advertising spending since the return on investment (ROI) will be limited. At the time of the Covid-19 pandemic, many companies did exactly that. Since demand far exceeded supply during the pandemic, advertising activity would have only exacerbated out-of-stock issues.

Some of the most successful companies, such as Colgate-Palmolive, have long histories of, and strategies for, improving their cost of goods sold to generate greater resources to put into marketing.

Source: S&P Global Market Intelligence.

Advertising remained relatively consistent as a percentage of total selling, general, and administrative (SG&A) expenses from 2013 through 2020 (close to 33%) in contrast to the advertising-to-R&D ratio, which remained low after a huge drop in 2015. In 2021 and 2022, however, the advertising/SG&A ratio increased to 35.1% and 34.5%, respectively, as companies ramped up advertising efforts in anticipation of the recovering economy and increased consumption. This also shows that companies had increased their advertising expenses to fend off competitors and tap into new markets rather than prioritizing R&D.

Notwithstanding, we think companies are actively looking for alternatives to cut costs (e.g., supply-chain efficiencies, headcount reduction, etc.) to offset the increase in R&D and advertising costs, as evidenced by the relatively stable total SG&A expenses across the industry. In our view, this could help the industry sustain EPS growth when external factors such as cost inflation, a global economic slowdown, or geopolitical factors present plausible and potent risks for margin compression.

Digital Marketing Boom

People are spending less time with traditional television and moving to digital media. According to market research firm eMarketer, in 2023, individuals aged 18 and up are expected to spend more than 64% of their daily media time on digital media and only 36% on traditional media. Consumers tend to actively watch digital media (*i.e.*, less multitasking involved) instead of passively watching television (*i.e.*, keeping the television running while preparing a meal), which is beneficial for companies looking to run ads on digital channels.

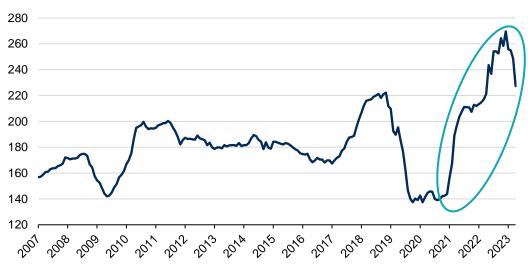

The large amount of data generated by online consumer behavior gave household products companies tremendous insight into allocating advertising spending to generate the greatest return. In the U.S., we have seen companies push personalized advertising within digital media to target younger demographics. However, companies still use television in many emerging markets to communicate with consumers.

Input Costs: Pulp

Commodities linked to the Household Products industry include crude oil, pulp, resins, natural gas, chemicals, industrial products, and fibers. Pulp prices have been very volatile, dating back to 2017 (see chart below). Pulp prices are now expected to pull back after an upcycle triggered by the Covid-19 recovery and supply chain constraints. Prices were feared to continue on an upcycle trend with the reopening of China but the fears have largely gone unrealized. In fact, with a confluence of a pull-back in consumer demand and pulp plants going live, there has been an overcapacity in the pulp market driving prices down sooner than initial projections of a pull-back in the second half of 2023.

PRODUCER PRICE INDEX: WOOD PULP

(Index from Jan. 2007, monthly)

Note: Data through May 2023.

Source: U.S. Bureau of Labor Statistics.

Input Costs: Plastics and Resins

Plastics and resins are also key raw materials for household products companies. As seen in the chart below, prices for plastics and resins have risen to historic highs, driven by strong global demand and tight supply. Increases in capacity in the second half of 2022 pressured prices and we expect this dynamic to play out through the rest of 2023. The uptick at the beginning of 2023 is attributed to the restocking of products but an expected uptick in supply and falling demand should reverse gains through the back half of 2023. Dampening of demand brought on by a recession would further push capacity and demand into equilibrium.

PRODUCER PRICE INDEX: PLASTIC AND RESINS MANUFACTURING

(Index from Jan. 2007, monthly; Dec 1980=100)

*Data through May.

Source: U.S. Bureau of Labor Statistics.

Input Costs: Freight

Transportation costs soared in 2021 and 2022 due to strong demand and major supply constraints in two critical components – drivers and tractors. The Cass Truckload Linehaul Index, which tracks per-mile truckload linehaul rates (independent of fuel), illustrates this trend in the chart below. The index rose 14.5% year-over-year in June 2021, the largest year-over-year increase since the data was first collected in 2005. The growth rate decelerated drastically in the second half of 2022 and declined year-over-year beginning in January 2023 and continued its descent in recent months. The fall is mainly attributed to declining real retail sales trends and ongoing destocking. However, Cass expects that the worst of the destocking is in the rearview mirror and expects improvement in demand due to a rise in real incomes.

CASS TRUCKLOAD LINEHAUL INDEX

(per-mile truck hauling rates - not including fuel, Y/Y change)

*Data through May.

Source: Cass Information Systems.

Supply Chain Disruptions

The Global Supply Chain Pressure Index integrates transportation cost data and manufacturing indicators to provide a gauge of global supply chain conditions. Since industry participants have supply chains in international markets, it is important to have an understanding of those conditions as supply chain pressures have been a large contributor to gross margin deterioration during the pandemic. As observed in the index, the worst of the supply chain pressures have abated since the December 2021 peak. Per the latest data, the recent downward trend has been driven by improvements in the Euro Area delivery times.

GLOBAL SUPPLY CHAIN PRESSURE INDEX (GSCPI)

*Data through May.

The Industry Is Being Transformed by New Demographic Trends

Americans are more racially and ethnically diverse than ever. Millennials now make up the largest generation of the U.S. labor force, and women now have a much larger role in the labor force than ever before. Additionally, despite a recent increase, Americans generally have fewer and fewer babies each year.

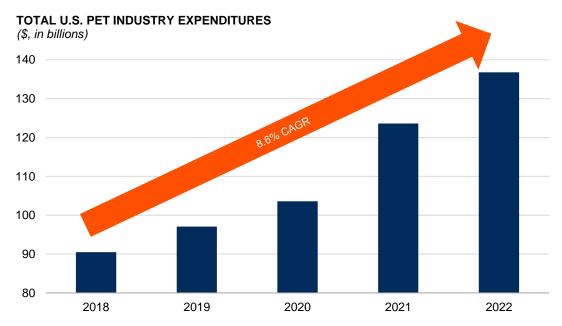

According to the Centers for Disease Control and Prevention, U.S. birth rates were flat in 2022 after increasing for the first time in seven years by 1% in 2021, with a recorded 3,661,220 births. However, it is important to note that birth rates had been on a downward trend, so the observed increase was coming off a low base figure and proved to be transient with flat birth rates in 2022. In comparison, birth rates fell 4% in 2020 from 2019 and were comparable to the number of births back in 1980. In 2021, the general fertility rate, which is a better metric to show national birth trends over time, also increased by 1% to 56.3 births per 1,000 women ages 15 to 44. The number was marginally higher than the historic low of 55.7 births per 1,000 women in 2020.

We think this is the outcome of several factors, including a cultural shift toward focusing on one's career over an intimate relationship and more women entering the workforce as the gender pay gap narrows (especially in leadership positions that require more time at work). Millennials completing major milestones later in life than previous generations could also be a contributing factor. Additionally, large amounts of student loan debt could make the prospect of forming a family feel more challenging until later in life. 2020 figures were also likely impacted by the Covid-19 pandemic, although this trend has occurred for several years prior to Covid-19. We see these dramatic shifts and trends as having a profound impact on the Household Products industry over the long term.

Pet Industry Growth Expected to Slow

The U.S pet industry has grown at a 12.1% CAGR between 2019 and 2022, per the American Pet Products Association. The pet industry is expected to grow to \$143.6 billion in 2023, representing an 11.5% CAGR between 2020 and 2023. We attribute the growth observed in the last 3.5 years to shelter-in-place orders across the U.S. that saw many taking up pets as house companions. In 2023, year-over-year growth will decelerate to 5%, which CFRA attributes to rising costs for both owners and pets. We note that the Pet Food and Treats segment accounted for 42.5% of the pet industry. It is projected to increase to 43.7% as owners cut on more discretionary items within the pet industry.

Alongside wild inflation that plagued the country for most of 2022, the cost of pet care also increased notably. Per NielsenIQ, dollar sales are up in the industry but units are on the decline with purchase assortment falling to levels lower than in the last three years. This has impacted emerging pet brands' ability to gain market share, with some choosing to cut assortments and narrow product offerings, which could benefit larger brands.

Source: American Pet Products Association.

Household products manufacturers that participate meaningfully in the pet food market include Colgate-Palmolive with the brand Hill's Science Diet, Church & Dwight with its Arm & Hammer cat litter products, and Clorox with its Fresh Step and Scoop Away brands of cat litter. Other leading participants are primarily food companies, including General Mills (Blue Buffalo), Mars (Pedigree, Royal Canin), Nestlé (Purina), and J.M. Smucker (Rachael Ray Nutrish, Nature's Recipe, Milk-Bone).

Personalization Megatrend

During the pandemic, consumers had time to dial in to their preferences, needs, and wants. In a constantly connected world where information is at consumers' fingertips, they have access to information that allows them to search for products and ingredients that can address those needs. Consumers are realizing that one size does not fit all and they are hesitating less to switch to better products that do fit their own needs. Euromonitor categorizes these consumers as personalization seekers and estimates that over 50% of consumers globally prefer goods or services uniquely tailored for them. Although the trend offers the potential to trade into different brands, we view large household products companies with portfolio offerings in the skin and hair segment as benefiting from this trend if effective innovation strategies are implemented.

Emergence of Sustainable and Earth-Friendly Products

Along with the personalization trend, consumers are also being educated about toxic chemicals and ingredients found in daily use products and are fueling a trend in demand for products that use sustainably sourced ingredients. We see this as an opportunity for household products participants to review their existing products to potentially source different ingredients for more skin-friendly and earth-friendly products. We see companies taking this initiative as gaining market share and extending consumer trust in their brands.

HOW THE INDUSTRY OPERATES

Companies in the Household Products industry develop and manufacture a variety of everyday household items, including soaps and other detergents like laundry detergents and bleaches; polishes and sanitation goods, including waxes and trash bags; and other cleansing agents.

Consumers buy household products at a variety of venues, including retail specialty stores, department stores, mass merchandisers, supermarkets, drugstores, and online sites. Among other factors, the makers of these products compete based on brand recognition, product quality and performance, and the level of service that they provide to the wholesalers and retailers that are their customers.

Product Mix

For a household products manufacturer, product mix – the type and quantity of merchandise it sells – is a critical factor in the company's success, even its survival. Because products sometimes appear to be indistinguishable from one another, a company's main objective is to develop brands that are well recognized by consumers. The goal is to attain a leading market share in a category that has an expanding customer base.

The nature and quality of a company's product mix affects the bottom line. For instance, personal products tend to carry higher profit margins than household goods. (Consumers seem to be less willing to experiment with lower-quality toothpaste or cosmetics than with cut-rate floor cleaner or bleach.) However, a low-price product may still be quite profitable if it sells in large volumes. Therefore, it is important for a company to offer a portfolio of products with an optimal mix of low- and high-margin items.

The Power of the Brand

For most consumers, a brand is more than a name – it's a lifestyle that allows one to feel a tremendous amount of loyalty to a product or service. From a household products manufacturer's perspective, it is one of the most genius ways for a company to indirectly build subscription-type revenue for a non-subscription product or service. A strong brand fosters consumer loyalty, which in turn creates opportunity for additional market share growth and above-average pricing flexibility. A company can also leverage a strong brand name by developing product line extensions.

Having a product with a leading market share is important for several reasons. First, the higher a company's market share, the more power it will have with retailers. This helps to ensure that its products are given prime shelf space. Second, if a product is in high demand, the company will be able to produce it in large volumes, resulting in manufacturing and distribution efficiencies. Third, substantial market share translates into more sales dollars, which the company can use for additional advertising and promotional spending to support the brand further.

Within each product category that a consumer products company offers, several brand names are generally available at different price points to appeal to customers of every income level. A range of products also gives a company an advantage in manufacturing and distribution and can help increase total market share in a category.

New Products Are the Key to Success

Given the maturity of the Household Products industry, new product development is a key driver of a company's future sales growth and a factor in determining market position. New products evolve largely through the efforts of a company's research and development (R&D) department, in conjunction with its marketing and product development division. Once new products are conceived and manufactured, they are test-marketed to determine their commercial viability.

Makers of household products try to develop new products as quickly as possible to be the first to enter the market. Once a new product has been on the market and consumers have begun to use it, competitors need to exert considerable marketing muscle to lure those customers away.

Another benefit of launching new products is that they typically carry higher profit margins than established items. Their special qualities, which manufacturers tout, are designed to appeal to a target market, and consumers are willing to spend more to obtain the real or perceived value added.

New product development, however, also carries risks. Efforts to create innovative or improved items increase development and marketing costs, and the new products might not succeed. Depending on the nature of the product, the time frame for a major manufacturer to conceive of a new product, develop and test-market it, and get it onto store shelves can be one to two years or longer. Introducing a "new and improved" version or a product line extension usually takes less time than inventing an entirely new product.

Cultivating Demand

Advertising and marketing budget play an important role in the success of a consumer product. Retaining existing customers is no easy feat but getting them to accept a completely new brand name is particularly difficult; it takes a tremendous amount of advertising to gain a potential customer's awareness. Through marketing and advertising, companies try to convey what certain brands "stand for" and to show consumers why and how these brands will meet their needs. Campaigns strive to get consumers' attention and persuade them to use a product repeatedly.

To assess the impact of advertising on their products' sales and market share, companies continuously monitor their marketing and advertising budgets. A good marketing and advertising program can help build all-important brand loyalty. Such loyalty can give the manufacturer flexibility in pricing the product and the opportunity to leverage the brand's name across several different product categories.

Value-priced products typically do not receive much in the way of advertising and marketing, because their margins are narrower than full-priced brands.

What Drives Demand?

Factors such as price, demographics, household income, and innovation are likely to affect the demand for household products and are taken into consideration by manufacturers in the R&D phase, as well as during later marketing years.

◆ Price. Many household products are considered necessities, so the quantity that a nation consumes tends to remain steady during periods of both recession and prosperity. However, the quality of the products purchased – as gauged by their relative prices – is directly related to real disposable personal income. A decline in disposable income puts downward pressure on consumer products prices. At such times, consumers often begin to favor lower-priced and private label goods over premium-priced brand name products.

Manufacturers offer products that target a specific range of price points. Although bargain brands' profit margins are generally lower than those of premium brands, they help the manufacturer keep capacity utilization at higher levels and thus maintain efficiency.

♦ **Demographics.** Overall demand for consumer products is closely linked to population growth. However, as the U.S. population ages, the rate of new household formations – a major driver of consumer goods demand – decreases correspondingly. Marketers study the age range, size, and spending patterns of their various target markets. With the U.S. population expanding at an annual rate of just under 1%, the domestic market for household products is slow growing and quite mature. The

prospect of limited population growth means that consumer goods companies must target existing markets very carefully in order to continue selling their products.

Manufacturers are finding more opportunities outside the U.S., in countries where populations are growing rapidly, and market penetration is lower. The U.S. Department of Commerce anticipates that the world's developing countries will continue to grow much more rapidly than developed countries. By 2050, the world population is expected to reach 9.7 billion, driven in part by growth in the 47 least developed countries, according to the United Nations. Accordingly, companies in the Household Products industry have made rapid expansions abroad in recent years.

- ♦ Household income. Demand for household products is also linked directly to household income trends. As a household's income level rises, its members tend to trade up from bargain products to premium ones. In addition, they tend to add certain products to their shopping baskets that they might not ordinarily have purchased, such as a special cleaner for the bathroom rather than just an all-purpose one. However, after a certain income level is reached, income is not a major determinant of demand for consumer staples. No matter how wealthy people may be, they can use only so much soap.
- ♦ Innovation. Companies create excitement for their products by adding or emphasizing benefits like convenience or ease of use. To be able to offer a breakthrough new product is of the utmost importance.

Manufacturing

Makers of household products use a variety of raw materials in both their products and their packaging. The cost to manufacture most household products depends largely on an array of chemical prices, while packaging expenses tend to mirror price shifts in petrochemicals and paper. Most of the large global manufacturers obtain their raw materials through global suppliers. In many cases, the manufacturers' buying power ensures reasonable terms. On average, raw materials account for 70% of the cost of goods sold for consumer products companies and almost evenly divided between ingredient and packaging costs. The remaining 30% includes labor and factory overhead expenses.

Many of the larger companies in the Household Products industry have separate manufacturing facilities for each of their product lines. A given facility may manufacture just one kind of product, like soap, or it may produce several items that use similar raw materials. Most products are made in computer-controlled continuous batches. Each production process follows proprietary formulas created by a company's R&D team. The entire process is highly automated – from initial ordering through manufacturing, product delivery, and billing.

As the industry has become more global, many companies have set up manufacturing operations throughout the world to help them align their product costs with their sales and/or the use of third-party manufacturers. This helps to protect profits from unfavorable currency movements and bolsters a company's competitive position against others trying to enter the market. Companies without foreign manufacturing facilities often use complex hedging strategies to protect profits from adverse currency movements.

Distribution

Once a product is manufactured, it is packaged and transferred to one of several places: a company distribution center, a customer distribution center, or a retail store. To reduce inventory levels, manufacturers and retailers have implemented computer systems that automate the flow of merchandise downstream. Through a process called continuous replenishment, manufacturers track their clients' sales in real-time and replenish once an inventory reaches a certain threshold. This helps to minimize inventories for both manufacturers and retailers, while avoiding costly stock shortages.

Government Regulation Affects All Areas

Virtually all of a household products manufacturer's operations are subjected to federal laws and regulations. In the U.S., the Food and Drug Administration (FDA) regulates manufacturing, labeling, and sale of over-the-counter (OTC) drug and cosmetic products. The U.S. Environmental Protection Agency (EPA) regulates substances used in manufacturing of disinfectant products. The Consumer Product Safety Commission (CPSC) regulates labeling of household products. The Federal Trade Commission (FTC) regulates packaging and labeling of all consumer products and monitors advertising practices of consumer products companies with respect to claims made about product functionality and efficacy. Household products are also subjected to regulation by various state laws and regulatory agencies, as well as those imposed by foreign jurisdictions.

Patents and Trademarks

Before a new product is marketed, patents or trademarks are obtained on the new formula, packaging, or technology to prevent imitation. These intellectual properties are valuable as it enables the company to seek damages from a competitor if infringed.

How the Big Get Bigger

On a local level, it is relatively easy to launch a household products company because the technological skills and financial resources required are not substantial. Although costs related to marketing and distribution are potentially significant, they can be kept to a minimum if there are enough establishments within reasonable proximity where the products can be sold.

Barriers to succeed on a grander scale, however, could be very high. For starters, access to capital for a larger manufacturing facility can be prohibitive. Next, more capital would be needed for advertising and marketing needed to capture and educate a new target market. Considering the high costs of manufacturing, marketing, and distribution, it is little wonder that large corporations dominate the Household Products industry.

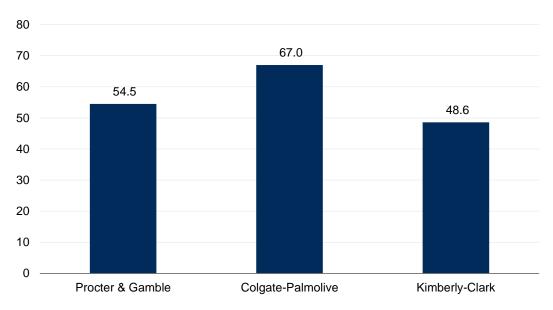

Many of the industry's large global players began by making one simple product, and, over the years, evolving into giant manufacturing powerhouses with highly developed distribution channels. Today, large companies that want to grow typically do so via international growth, often through acquisitions or joint ventures.

International Outreach

Compared to the other industries in the Consumer Staples sector, the Household Products industry has greater exposure to international markets, which are the source of about 50% or more of sales from the three largest participants (Procter & Gamble, Colgate-Palmolive, and Kimberly-Clark) in the industry.

PERCENTAGE NET SALES OUTSIDE U.S.

(FY 22, in percent)

Source: Company reports.

Some basic products have universal appeal, and expanding their markets worldwide is relatively easy. When trying to enter foreign markets, companies use several strategies. These include building a worldwide brand and infrastructure from scratch, acquiring local infrastructure and using it to expand their U.S. franchises, acquiring sizable existing country or regional franchises, and establishing joint ventures with local companies.

With significant international operations come a full range of risks, such as fluctuation in exchange rates for foreign currencies, limits imposed on import and export of raw materials or finished products, political and economic instability, and foreign ownership restrictions.

Several large household products manufacturers enter foreign markets via partnerships with local companies. Joint ventures allow a company to test the waters without having to create an infrastructure from scratch, which is usually a costly and lengthy endeavor. In addition, such partnerships allow companies to learn a market's customs, tastes, and regulatory issues from partners.

Once such market knowledge is established, the company could acquire its partners and expand the business through more joint ventures and/or acquisitions. However, this strategy carries certain risks. One danger, particularly in countries with less developed intellectual property rights, could be the local partner imitating the products or business process and circumventing the joint venture agreement by selling goods outside the partnership.

HOW TO ANALYZE A COMPANY IN THIS INDUSTRY

Analysis of a company in the Household Products industry must be based on a range of factors, both quantitative and qualitative. Quantitative evaluation comes from studying the company's income statement, balance sheet, and cash flow data, with an eye toward growth trends, comparative statistics, and performance ratios. In contrast, many qualitative factors, such as the strength of a company's management team, must be assessed subjectively.

Qualitative Factors

Assessing the Business

In the Household Products industry, a company's most important features are its brand names, product mix, market share, and competitive position. The firm's geographical diversification and plans for international expansion are also important. While some of these factors, such as market share statistics, can be quantified, an overall assessment of these areas is largely subjective.

Market Position and Brand Strength

Market leadership – having a brand that outsells all other similar products by a significant margin – is the big dream for consumer products companies. Dominance in a product category offers a company many benefits, including greater negotiating power with suppliers and retailers, and the potential to realize substantial economies of scale. Competitive advantages are particularly evident in areas of raw materials procurement, manufacturing efficiency, and marketing.

Market position is related to brand strength; therefore, the two characteristics should be considered together. Indeed, brand strength is best measured by how well a product sells relative to competing products. Does the company have several brands that lead its market segments?

Product Mix and Competitive Environment

Many of the large manufacturers of household products have extremely diversified product lines. Therefore, they typically face different competitors in each category.

An investor should assess how many competitors the company has in each product category and their respective market shares; whether rival products are gaining or losing market share; if the category has any private label competition; and whether the category itself is growing, declining, or stagnating.

Quantitative Factors

The first step in quantitative analysis should be to dissect the components of the income statement. To reduce seasonal factors, results should be compared with the year-earlier period. Comparing sales and earnings trends over a longer period can also be revealing. In addition, a company's results should be compared with those of its competitors.

Afterward, the cash flow and balance sheet statements should be analyzed for financial strength, changes in financial position, and other key indicators, as described below. Finally, performance ratios help to put these figures into perspective.

Components of the Income Statement

The most basic review of the income statement includes an analysis of sales, gross margins, operating margins, interest expense, and net income – the bottom line. Earnings per share (EPS) and the price-to-earnings (P/E) ratio help investors put a value on the company's stock.

◆ Sales. Net sales growth is a sign of health for a business. However, one needs to look at how a company's sales growth compares with that of its market, in general, and of its specific competitors. It is also important to determine what is behind any sales growth (pricing, unit volume gains, acquisitions, divestitures, etc.) and if the company is gaining market share, or if it is just riding market growth spurts.

With a rising percentage of sales made outside the U.S., overall sales figures are likely to be affected (for better or worse) by fluctuations in foreign currency exchange rates. Other factors that can affect sales figures include new product introductions, a shift in contributions from mature industrialized nations vs. emerging growth countries, and/or weak economies in a geographic market.

Watch Out! Costs for bad debts, sales returns, obsolete inventory, and other provisions are estimated by management and recorded as either expenses or offsets to revenue (depending upon the provision). Management has discretion in calculating these estimates, and therefore has the ability to manipulate earnings, and sometimes revenues. Specifically, by under-provisioning or reversing previous provisions, management can generate artificial, and therefore unsustainable, earnings.

Watch Out! Companies may hide a revenue slowdown by recognizing revenue in an earlier period than originally expected. As such, the reported revenue growth during a period in which revenue has been accelerated is likely unsustainable. Some of the tactics include allocating a higher proportion of transaction price to elements delivered upfront in contracts with multiple deliverables or performance obligations, faster recognition of deferred revenue, large shipments at period-end, a change in revenue recognition policy, and a change in the interpretation of the revenue recognition policy.

♦ Gross profit margins. Defined as sales minus cost of goods sold (COGS), and expressed as a percentage of sales, gross margins generally reflect a company's product mix and its operational efficiency. Often, the higher the volume a company produces and the more stable its manufacturing processes, the more efficient its operations. It is important to understand the reasons for any year-to-year changes in a company's gross margins and to compare the margins with those of other companies in the same business. Cutting prices to boost demand may temporarily increase volume and therefore sales comparisons, but gross margins may suffer.

Changes in raw material prices, a major component of COGS, can also have a major impact on gross margins. If prices of raw materials rise and a company is unable to pass on the higher costs to customers, it will have to absorb the additional costs. To lessen the impact on profit margins, manufacturers typically use their global purchasing power to seek out the least expensive raw material prices, often buying the materials on a futures basis. Some companies maintain reserves on their balance sheets for negative swings in raw material prices, so that a sudden increase will not adversely affect the company's results.

- ♦ Operating margin. The performance of the operating margin considers the operating expenses required to run the business. These costs include rent, advertising and promotion, research and development (R&D), and employee payrolls. The operating margin equals operating income divided by sales. Because operating expenses are generally more controllable than raw materials costs, year-to-year changes in this ratio can be used to measure how efficiently a company is running its business. Ideally, over time, a company should show declining operating expenses as a percentage of sales.
- ♦ Interest expense. The manufacturing of household products is not particularly capital intensive, so interest expense typically is not a big line item for these companies. Most interest charges are related to borrowing costs for acquisitions or share repurchases.

If interest charges show a substantial increase, the investor should ask why. For example, a major acquisition or investment in new manufacturing facilities could be a bullish sign that the company predicts increased demand for its products, or that it is expanding overseas. At the same time, increased debt leverage and the associated interest charges may crimp near-term earnings and reduce the amount of funds available for investment in the business.

♦ Net income. This is the bottom line. Net income measures the profits or losses of a company. An investor should be on the lookout for special items that can distort the net income figure. Special (or "extraordinary" or "nonrecurring") credits could include a profit gain from an asset sale, favorable legal settlements, or a one-time benefit from a change in accounting practices.

Special charges can result from business restructuring initiatives, losses derived from asset sales, an unfavorable legal decision, or a change in accounting practices. In recent years, many of the major U.S. companies in the Household Products industry incurred such charges, mostly to restructure existing operations. These charges against earnings were often taken to pay the costs of consolidating facilities, reduce excess manufacturing capacity, dispose of underperforming or nonstrategic businesses, and lay off employees.

Watch Out! Companies record special charges for unusual or infrequent items, e.g., restructuring charges. Such charges are often excluded from non-GAAP earnings, and therefore provide dishonest management with the ability to enhance analysts' perception of its profitability through aggressive use of these special charges.

Watch Out! Companies in the Household Products industry are fixed asset intensive, making depreciation a significant expense for most of these companies. Since depreciation is based on estimates of asset lives, management can manipulate these estimates to manage earnings. Also, be wary of companies where capital expenditures consistently exceed depreciation as these companies may be understating depreciation expense or may experience an increase in depreciation expense in future periods.

♦ Earnings per share. Defined as net income divided by the number of shares outstanding, earnings per share (EPS) represents the amount of profits available to each stockholder. After adjusting for special items, it is useful to look at EPS trends over the course of a few years to determine a company's underlying health. However, keep in mind that companies have some flexibility in bolstering the EPS figure. For example, a company can increase the amount of stock it repurchases, or it can temporarily trim its marketing budget.

Cash Flow Figures

Cash flow numbers show where a company is putting its earnings to work. Most of the larger U.S. companies in the Household Products industry generate substantial amounts of free cash that can be put to work beyond the upkeep of existing equipment. Free cash flow is often defined as net income plus depreciation and amortization minus capital expenditures and cash dividends. Free cash can be used to reduce debt, repurchase shares, make acquisitions, enter new markets, or reinvest in existing operations, automation, or technology. It is important for a company to find the optimal balance between reinvesting free cash into its business and using the cash to reward shareholders.

Looking at the Balance Sheet

It is important to examine several balance sheet ratios to assess a company's financial position and to catch early signs of possible cash flow problems. A significant drop in a company's current ratio (current assets divided by current liabilities) can signal a potential drain on the capital needed to run the business. In addition, an unusual inventory increase could lead to an asset write-down and could slow

production. The rate of inventory turnover (inventory divided by the sales ratio) can reveal changes in production or inventory bottlenecks.

◆ **Debt leverage.** A company's debt leverage can be measured with either of two standard ratios: debt to shareholders' equity, or long-term debt as a percentage of total invested capital (total invested capital is the sum of stockholders' equity, long-term debt, capital lease obligations, and deferred income taxes). Investors must weigh the benefits and disadvantages of various debt levels. An increased debt load can enhance earnings growth and shareholder returns. On the other hand, a clean balance sheet allows for a greater degree of safety, a potentially higher credit rating, and ready availability of funds for any potential opportunity.

Performance Ratios

To determine how well a company uses its resources, analysts look at such ratios as return on assets (ROA), which is profits divided by average assets; and return on equity (ROE), or profits divided by average equity. High ROA and ROE ratios are generally viewed as positive signs that a company is maximizing performance.

Valuation Measures

◆ Price-to-earnings ratio. When valuing a company's stock, a good place to start is the basic investment ratio of stock price-to-earnings per share, the P/E ratio. This ratio (or earnings multiple) serves as a benchmark for valuing the company's stock against those of its peers, companies outside the Household Products industry, stock indices (such as the S&P 500), and the company's historical average earnings multiple.

Typically, the P/E ratio of a stock will be related to the company's projected growth rate, and investors generally award a higher ratio to a company that has prospects for rapid earnings growth.

♦ Discounted cash flows. Investors may also use discounted cash flows to help determine the intrinsic values of companies in the household products area. The intrinsic value of a company's common stock generally equals the present value of its free cash flow to equity holders. Using discounted cash flow methodologies may help avoid the pitfalls associated with relative valuation; for example, an overvalued stock may appear attractive because it is being compared with another stock that is even more overvalued.

GLOSSARY

All-new products—A category of new product development that consists of adopting new formulas based on a newly developed concept. For example, following the launch of Clorox's disinfectant wipes in 1999, Procter & Gamble introduced Swiffer dry electrostatic cloths in 2000.

Breadth of brands—The number of brands carried by a company within a product classification. The brands usually have different price points. For example, Procter & Gamble offers several different laundry detergents, including Tide, Gain, and Cheer.

Consumer packaged goods (CPG)—Goods that are replaced more frequently than durable goods. Examples of CPG products are batteries, cosmetics, disposable diapers, laundry detergent, toothpaste, and toilet tissue.

Fast-moving consumer goods (FMCG)—Products that are sold quickly and at relatively low costs such as packaged foods, household products, over-the-counter drugs, and other consumables.

Mass merchandisers—Retailers that provide a one-stop shop for groceries as well as appliances, furniture, accessories, clothing, etc.

Membership club stores—Retail stores, usually selling a wide variety of merchandise, in which customers may buy large, wholesale quantities of the store's products, which makes these clubs attractive to both bargain hunters and small business owners.

Millennials—People born between 1981 and 1996.

New and improved products—A category of new product development that focuses on tweaking formulas or packaging to provide an improvement over the original product. For example, Kimberly-Clark offered Kleenex tissues in oval-shaped boxes with new patterns for a limited time.

Private label goods—A product line manufactured under contract for, and distributed exclusively by, a wholesaler/retailer.

Product cannibalization—A reduction in sales volume, sales revenue, or market share of one product as a result of the introduction of a new product by the same producer.

Product line extension—Occurs when a company adds new products in an existing product line. For example, there are different varieties of Tide laundry detergent from Procter & Gamble.

Restructuring—The process of modifying a company's organizational structure, which is usually undertaken to reduce cost. Kimberly-Clark's pulp-and-tissue restructuring plan and Procter & Gamble's five-year cost-reduction program are examples of restructuring efforts conducted by household products companies.

Disclosure

CFRA's Industry Surveys Reports (the "Industry Surveys") have been prepared by Accounting Research & Analytics, LLC and/or one of its affiliates. The Industry Surveys are published and originally distributed by Accounting Research & Analytics, LLC d/b/a CFRA ("CFRA US"), with the following exceptions: In the United Kingdom/European Union/European Economic Area, the Industry Surveys are published and originally distributed by CFRA U.K. Limited (company number 08456139 registered in England & Wales with its registered office address at New Derwent House, 69-73 Theobalds Road, London, WC1X 8TA, United Kingdom), which is regulated by the U.K. Financial Conduct Authority (No. 775151); in Malaysia, the Industry Surveys are published and originally distributed by CFRA MY Sdn Bhd (Company No. 683377-A) and regulated by Securities Commission Malaysia, No. CMSL/A0181/2007 ("CFRA Malaysia"). CFRA Malaysia is a wholly-owned subsidiary of CFRA US. For Recipients in Canada: This report is not prepared subject to Canadian disclosure requirements and may not be suitable for Canadian investors.

The content of this report and the opinions expressed herein are those of CFRA based upon publicly-available information that CFRA believes to be reliable and the opinions are subject to change without notice. This analysis has not been submitted to, nor received approval from, the United States Securities and Exchange Commission or any other regulatory body. While CFRA exercised due care in compiling this analysis, CFRA AND ALL RELATED ENTITIES SPECIFICALLY DISCLAIM ALL WARRANTIES, EXPRESS OR IMPLIED, to the full extent permitted by law, regarding the accuracy, completeness, or usefulness of this information and assumes no liability with respect to the consequences of relying on this information for investment or other purposes.

No content (including ratings, credit-related analyses and data, valuations, model, software or other application or output therefrom) or any part thereof (Content) may be modified, reverse engineered, reproduced or distributed in any form by any means, or stored in a database or retrieval system, without the prior written permission of CFRA. The Content shall not be used for any unlawful or unauthorized purposes. CFRA and any third-party providers, as well as their directors, officers, shareholders, employees or agents do not guarantee the accuracy, completeness, timeliness or availability of the Content.

Past performance is not necessarily indicative of future results. This document may contain forward-looking statements or forecasts; such forecasts are not a reliable indicator of future performance.

This report is not intended to, and does not, constitute an offer or solicitation to buy and sell securities or engage in any investment activity. This report is for informational purposes only. Recommendations in this report are not made with respect to any particular investor or type of investor. Securities, financial instruments or strategies

mentioned herein may not be suitable for all investors and this material is not intended for any specific investor and does not take into account an investor's particular investment objectives, financial situations or needs. Before acting on any recommendation in this material, you should consider whether it is suitable for your particular circumstances and, if necessary, seek professional advice.

CFRA may license certain intellectual property or provide services to, or otherwise have a business relationship with, certain issuers of securities that are the subject of CFRA research reports, including exchange-traded investments whose investment objective is to substantially replicate the returns of a proprietary index of CFRA. In cases where CFRA is paid fees that are tied to the amount of assets invested in a fund or the volume of trading activity in a fund, investment in the fund may result in CFRA receiving compensation in addition to the subscription fees or other compensation for services rendered by CFRA, however, no part of CFRA's compensation for services is tied to any recommendation or rating. Additional information on a subject company may be available upon request.

CFRA's financial data provider is S&P Global Market Intelligence. THIS DOCUMENT CONTAINS COPYRIGHTED AND TRADE SECRET MATERIAL DISTRIBUTED UNDER LICENSE FROM S&P GLOBAL MARKET INTELLIGENCE. FOR RECIPIENT'S INTERNAL USE ONLY.

The Global Industry Classification Standard (GICS®) was developed by and/or is the exclusive property of MSCI, Inc. and S&P Global Market Intelligence. GICS is a service mark of MSCI and S&P Global Market Intelligence and has been licensed for use by CFRA.

Credit ratings are statements of opinions and are not statements of fact or recommendations to purchase, hold or sell securities. They do not address the suitability of securities or the suitability of securities for investment purposes, and should not be relied on as investment advice."

Certain information in this report may be provided by Securities Evaluations, Inc. ("S.E."), a wholly owned subsidiary of Intercontinental Exchange. SE is a registered investment adviser with the United States Securities and Exchange Commission (SEC). S.E.'s advisory services include evaluated pricing and model valuation of fixed income securities, derivative valuations and Odd-Lot Pricing that consists of bid- and ask-side evaluated prices for U.S. Municipal and U.S. Corporate Securities (together called valuation services). Such information is subject to the following disclaimers and notices: "No content (including credit-related analyses and data, valuations, model, software or other application or output therefrom) or any part thereof (Content) may be modified, reverse engineered, reproduced or distributed in any form by any means, or stored in a database or retrieval system, without the prior written permission of S.E. The Content shall not be used for any unlawful or unauthorized purposes, S.E. and any third-party providers, as well as their directors, officers, shareholders, employees or agents (collectively S.E. Parties) do not guarantee the accuracy, completeness, timeliness or availability of the Content. S.E. Parties are not responsible for any errors or omissions (negligent or otherwise), regardless of the cause, for the results obtained from the use of the Content, or for the security or maintenance of any data input by the user. The Content is provided on an "as is" basis. SE PARTIES DISCLAIM ANY AND ALL EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, ANY WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR USE, FREEDOM FROM BUGS, SOFTWARE ERRORS OR DEFECTS, THAT THE CONTENT'S FUNCTIONING WILL BE UNINTERRUPTED OR THAT THE CONTENT WILL OPERATE WITH ANY SOFTWARE OR HARDWARE CONFIGURATION.

In no event shall S.E. Parties be liable to any party for any direct, indirect, incidental, exemplary, compensatory, punitive, special or consequential damages, costs, expenses, legal fees, or losses (including, without limitation, lost income or lost profits and opportunity costs or losses caused by negligence) in connection with any use of the Content even if advised of the possibility of such damages. Credit-related and other analyses and statements in the Content are statements of opinion as of the date they are

expressed and not statements of fact or recommendations to purchase, hold, or sell any securities or to make any investment decisions. S.E. assumes no obligation to update the Content following publication in any form or format. The Content should not be relied on and is not a substitute for the skill, judgment and experience of the user, its management, employees, advisors and/or clients when making investment and other business decisions. S.E.'s opinions and analyses do not address the suitability of any security. S.E. does not act as a fiduciary or an investment advisor. While S.E. has obtained information from sources it believes to be reliable, S.E. does not perform an audit and undertakes no duty of due diligence or independent verification of any information it receives. Valuations services are opinions and not statements of fact or recommendations to purchase, hold or sell any security or instrument, or to make any investment decisions. The information provided as part of valuations services should not be intended as an offer, promotion or solicitation for the purchase or sale of any security or other financial instrument nor should it be considered investment advice. Valuations services do not address the suitability of any security or instrument, and securities, financial instruments or strategies mentioned by S.E. may not be suitable for all investors. S.E. does not provide legal, accounting or tax advice, and clients and potential clients of valuation services should consult with an attorney and/or a tax or accounting professional regarding any specific legal, tax or accounting provision(s) applicable to their particular situations and in the countries and jurisdictions where they do business. S.E. has redistribution relationships that reflect evaluated pricing, derivative valuation and/or equity pricing services of other unaffiliated firms with which S.E. has contracted to distribute to its client base. Pricing and data provided by these third-party firms are the responsibilities of those firms, and not S.E., and are produced under those firms' methodologies, policies and procedures. Valuations services provided by S.E. and products containing valuations services may not be available in all countries or jurisdictions. Copyright © 2023 by Intercontinental Exchange Inc.
